TITLE:
Summer Campaign Strategy & Creative Execution — Restaurant Brand (Concept Project)

This is a self-initiated concept project developed to demonstrate practical digital marketing strategy skills across creative execution, campaign tracking, and performance optimization for a vegan restaurant brand.

Background

This project focused on developing a practical and cost-effective digital marketing strategy for a vegan restaurant brand. The aim was to strengthen online presence, attract more customers, and build a clearer digital communication strategy by combining creative execution with performance marketing fundamentals.

Given the limited budget, the strategy prioritized accessible and low-cost channels that could support visibility, engagement, and future campaign scalability.

Objective:

Develop a cost-effective multi-channel digital marketing strategy to increase online visibility, customer engagement, and footfall for a vegan restaurant brand with a limited budget.

Problem

The brand needed a stronger digital presence and a more structured way to engage customers across online channels. Key challenges included limited discoverability, inconsistent engagement opportunities, and the absence of a clear framework for tracking campaign effectiveness.

The project therefore focused on building a simple but scalable marketing approach that balanced creativity, affordability, and measurable performance thinking

CHANNELS USED

- Google My Business
- Instagram & Facebook
- Email Marketing
- YouTube / Local collaborations
- WhatsApp & SMS marketing

These channels were selected based on reach, cost-effectiveness, and user behaviour and popularity in the area.

STRATEGY

A focused campaign approach was developed around three key ideas:

- Seasonality: Using summer-themed messaging (“Summer in a Glass”) to make the content more relevant and timely
- Emotional Messaging: Creating relatable lines such as “We know you are hungry” to connect with user intent
- Visual Clarity: Designing clean, attention-grabbing creatives with strong product appeal

Creative Execution

The focus was on clear messaging, attractive visuals, highlighting offers and creating urgency. For example, improved messaging like “We know you are hungry” was used to create an emotional connection with users.

Social Media Post-

To improve campaign performance, the following testing approaches were applied:

1. Seasonality impact on performance, seasonal messaging was used to increase relevance and align creatives with user context.
2. A hero-product approach was introduced to test whether highlighting one standout item would create better visual clarity than showing multiple products at once. This approach was intended to reduce clutter, focus user attention, and make the message easier to process quickly.

This creative uses seasonal messaging and vibrant visuals to attract attention and create a refreshing summer appeal. The design focuses on product visibility and simple messaging to improve user engagement.

A/B Testing Framework

A structured testing framework was built into the campaign concept to compare how different creative and messaging choices could influence user response.

The testing areas included:

- **Visual approach:** single hero dish versus multi-product layout
- **Messaging style:** emotional messaging versus offer-based communication
- **Format:** static creatives versus carousel-style posts

The purpose of this framework was to identify which combination of message, visual focus, and format would most effectively drive engagement and support stronger campaign performance.

For example, messaging like “We know you are hungry” created stronger emotional connection with users compared to neutral messaging, as it directly connects with user intent and emotions.

Challenges

- Limited budget required reliance on low-cost channels
- Balancing creative content with performance thinking
- Understanding how to track and measure campaign effectiveness
- Designing content that stands out while remaining simple and clear

Results & Key Insights

- Seasonal messaging improved content relevance and made the campaign more aligned with user context, especially using “Summer in a Glass”
- Visually strong creatives with bold colors were more effective in attracting attention
- Emotional messaging such as “We know you are hungry” performed better than generic promotional lines by directly connecting with user intent
- Simpler creatives with a clear product focus (hero dish approach) provided better clarity and reduced visual overload compared to multi-product layouts

Overall, this project showed me that even small changes in messaging, timing, and visual focus can influence how users interact with content.

Performance Indicators

As this is more of an exploratory project, but if this campaign is to be implemented the following key performance indicators would be measured:

1. **Engagement Rate** (likes, shares, interactions) to evaluate how relevant the content feels to users
2. **Click-Through Rate (CTR)** to understand how effective the creative is in capturing attention; CTR indicates how effectively a creative captures attention, while engagement rate reflects how relevant and appealing the content is to users.

This project reflects a concept-based approach, and the next step would be to validate these insights through live campaign execution and measurable performance data.
